# **Contents**

| 1 Overview                                        | 1  |
|---------------------------------------------------|----|
| 2 Version Mapping                                 | 2  |
| 3 Manila Driver Installation&deployment           | 6  |
| 3.1 Obtain Manila Driver                          | 7  |
| 3.2 Ubuntu Environment Deployment                 | 7  |
| 4 Manila Driver Basis Properties Configuration    | 9  |
| 5 Manila Driver Advanced Properties Configuration | 13 |
| 5.1 Property Configuration                        | 15 |
| 5.2 SmartDedupe Property Configuration            | 15 |
| 5.3 SmartCompression Property Configuration.      | 15 |
| 5.4 SmartCache Property Configuration             | 16 |
| 5.5 SmartPartition Property Configuration         | 16 |
| 5.6 SmartQoS Property Configuration               | 16 |
| 5.6.1 QoS Configuration Versions                  | 17 |
| 5.6.2 Configuring the Control IOPS                | 17 |
| 5.6.2.1 Configuring the Maximum Control IOPS      | 17 |
| 5.6.2.2 Configuring the Minimum Control IOPS      | 17 |
| 5.6.3 Configuring the Control Bandwidth           | 18 |
| 5.6.3.1 Configuring the Maximum Control Bandwidth | 18 |
| 5.6.3.2 Configuring the Minimum Control Bandwidth | 18 |
| 5.6.4 Configuring the Control Latency             | 19 |
| 5.6.5 Configuring Multiple Control Policies       | 19 |
| 5.7 Create a share on a certain storage pool      | 20 |
| 5.8 Create a share with a certain disk type       | 20 |
| 5.9 SectorSize Configuration                      | 20 |
| 5.10 Replication Configuration.                   | 21 |

# $\mathbf{1}$ Overview

This chapter describes the definition of Manila Driver.

Manila Driver is a plug-in that is deployed on the OpenStack Manila module. The plug-in can be used to provide functions such as share and snapshot for virtual machines (VMs) in OpenStack.

# 2 Version Mapping

This chapter describes versions and functions supported by Manila Driver, and its version mappings with Huawei storage systems and OpenStack.

**Table 2-1** Version mappings among the Manila Driver, Huawei storage system and OpenStack. ( $\checkmark$ : support, x: unsupport)

| Huawei storage<br>system                | Kilo | Liberty | Mitaka | Newton | Ocata |

# 3 Manila Driver Installation&deployment

- 3.1 Obtain Manila Driver
- 3.2 Ubuntu Environment Deployment

#### 3.1 Obtain Manila Driver

Two ways to obtain OpenStack Driver:

One is through the OpenStack community warehouse. From Kilo, Huawei has contributed Huawei Storage Driver to OpenStack, users can download OpenStack Driver from OpenStack community for free. After installing the specified OpenStack, OpenStack Driver will be placed under the catalog of "../manila/manila/share/drivers/huawei". If you don't find the corresponding installation files, you can download the OpenStack Driver from OpenStack community warehouse at https://github.com/openstack/manila.

Another is through Huawei OpenStack Driver warehouse. By visiting https://github.com/huaweistorage/OpenStack\_Driver, you can download OpenStack Driver that corresponds to OpenStack community version.

Steps to get Manila Driver are as follows:

#### MOTE

After Kilo, Huawei OpenStack Driver is included in OpenStack community version , ignore the subsequent steps, jump to the relevant section to configure properties.

- **Step 1** Enter the above warehouse address in the browser, for example Huawei warehouse address: https://github.com/huaweistorage/OpenStack\_Driver.
- Step 2 Click the "Download ZIP" bottom to download Driver, and unzip it.
- **Step 3** Find "Manila" catalog in which the Diver is extracted, there are multiple OpenStack Driver for different OpenStack version, choose the corresponding Driver.

----End

# 3.2 Ubuntu Environment Deployment

The OpenStack standard deployment steps are as follows:

**Step 1** Before installation, delete all the installation files of Huawei OpenStack Drver, the default path is /usr/lib/python2.7/dist-packages/manila/share/drivers/huawei.

## CAUTION

On my host, the version of Python is 2.7, if other version is used, make corresponding changes to the Driver path.

- **Step 2** Copy OpenStack Manila Driver to Manila Driver installation directory, the default directory refer to step 1.
- **Step 3** Refer to chapter 4 and 5 to do the configuration.
- **Step 4** After configuration, restart Manila-Share service:

service manila-share restart

**Step 5** Check the status of services by inputting manila service-list, if the "State" status of Manila-Share is up, that means Manila-Share is OK.

Except the above method, check /var/log/manila/manila-share.log to confirm whether Manila-Share is OK

# 4 Manila Driver Basis Properties Configuration

This chapter describes how to configure Huawei Manila Driver.

In OpenStack Ocata Manila, when create a share without a share type, the default share type in "/etc/manila/manila.conf" file will be used.

```
[DEFAULT]
default_share_type = default_share_type
```

If the default share type does not exist, please create it.

If you want to use the snapshot feature of shared files, set **snapshot\_support** to **True** in **share type**.

```
root@ubuntu-001:~# manila type-key default share type set snapshot support=True
```

If you want to use snapshots to create shared files, set

create share from snapshot support to True in share type.

```
root@ubuntu-001:~# manila type-key default_share_type set create_share_from_snapshot_support=True
```

#### **Procedure**

**Step 1** Modify the **manila.conf** configuration file of Manila. Add **share\_driver** and **manila\_huawei\_conf\_file**,and modify **driver\_handles\_share\_servers**.

manila huawei conf.xml is used as an example.

• Example for configuring a storage system:

```
share_driver = manila.share.drivers.huawei.huawei_nas.HuaweiNasDriver
manila_huawei_conf_file = /etc/manila/manila_huawei_conf.xml
driver handles share servers = False
```

• Example for configuring multiple storage systems:

```
enabled_backends = huawei_manila_1, huawei_manila_2
[huawei_manila_1]
share_driver = manila.share.drivers.huawei.huawei_nas.HuaweiNasDriver
manila_huawei_conf_file = /etc/manila/manila_huawei_conf_1.xml
driver_handles_share_servers = False
[huawei_manila_2]
share_driver = manila.share.drivers.huawei.huawei_nas.HuaweiNasDriver
manila_huawei_conf_file = /etc/manila/manila_huawei_conf_2.xml
driver handles share servers = False
```

#### **□**NOTE

- The parameter value of **driver\_handles\_share\_servers** can be **True** or **False**. **True** indicates that the multi-tenant mode is supported and **False** indicates that the multi-tenant mode is not supported.
- **Step 2** In /etc/manila, create a driver configuration file named manila\_huawei\_conf.xml. The driver configuration file name must be the same as value of the manila\_huawei\_conf\_file item in the manila.conf configuration file.

Details about the driver configuration file are as follows:

```
<?xml version='1.0' encoding='UTF-8'?>
<Config>
<Storage>
         <Product>V3</Product>
         <LogicalPortIP>x.x.x.x</LogicalPortIP>
         <Port>abc;CTE0.A.H1</Port>
         <RestURL>https://x.x.x.x:8088/deviceManager/rest/</RestURL>
         <UserName>xxxxxxxxxx/UserName>
         <UserPassword>xxxxxxxxxx</UserPassword>
         <SnapshotSupport>True</SnapshotSupport>
         <ReplicationSupport>False</ReplicationSupport>
</Storage>
<Filesystem>
         <StoragePool>xxxxxxxxxx;xxxxxxxx</StoragePool>
         <SectorSize>64</SectorSize>
         <WaitInterval>3</WaitInterval>
         <Timeout>60</Timeout>
         <NFSClient>
             <IP>x.x.x.x</IP>
         </NFSClient>
         <CIFSClient>
             <UserPassword>xxxxxxxxxx</UserPassword>
         </CIFSClient>
</Filesystem>
</Config>
```

**Table 4-1** lists all parameters in the configuration file.

**Table 4-1** Parameters in the configuration file

| Parameter     | Default Value | Description              | Type                                      |
|---------------|---------------|--------------------------|-------------------------------------------|
| Product       | V3            | Storage product model.   | Mandatory.                                |
| LogicalPortIP | -             | Logical port IP address. | Mandatory when not in multi-tenancy mode. |

| Parameter               | Default Value | Description                                                                                           | Туре                                                                              |
|-------------------------|---------------|-------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Port                    | -             | Port name list of<br>bond port or ETH<br>port, used to create<br>vlan and logical<br>port.            | If <port> is not configured, then will choose an online port on the array.</port> |
| RestURL                 | -             | Access address of the REST interface.                                                                 | Mandatory.                                                                        |
| UserName                | -             | User name of an administrator.                                                                        | Mandatory.                                                                        |
| UserPassword            | -             | Password of an administrator.                                                                         | Mandatory.                                                                        |
| StoragePool             | -             | Name of a storage pool to be used.                                                                    | Mandatory.                                                                        |
| SectorSize              | 64            | The size of the disk blocks, optional value can be "4", "8", "16", "32" or "64", and the units is KB. | Optional.                                                                         |
| SnapshotSupport         | True          | Support snapshot or not.                                                                              | Optional.                                                                         |
| ReplicationSupport      | False         | Support replication or not.                                                                           | Optional.                                                                         |
| WaitInterval            | 3             | Interval for querying file system status. The unit is second.                                         | Optional.                                                                         |
| Timeout                 | 60            | Timeout interval for waiting command execution of a storage device to complete. The unit is second.   | Optional.                                                                         |
| NFSClient\IP            | -             | Backend IP in admin<br>network to use for<br>mounting NFS<br>share.                                   | Mandatory when create a share from snapshot.                                      |
| CIFSClient<br>\UserName | -             | Backend user name in admin network to use for mounting CIFS share.                                    | Mandatory when create a share from snapshot.                                      |

| Parameter                   | Default Value | Description                                                       | Туре                                         |
|-----------------------------|---------------|-------------------------------------------------------------------|----------------------------------------------|
| CIFSClient<br>\UserPassword | -             | Backend password in admin network to use for mounting CIFS share. | Mandatory when create a share from snapshot. |

#### NOTE

- You can configure multiple RestURL, storage pools and ports in the configuration file and separate them using semicolons(;).
- For details about share configuration information, see the **show share** command in the specific command-line interface (CLI) document.
- Snapshot and Replication can't be configured at the same time.

**Step 3** Restart the Manila services.

# 5 Manila Driver Advanced Properties Configuration

This chapter describes how to configure advanced storage properties.

Huawei storage supports advanced properties, such as Smartx. By associating with specified share types, these properties can be used in OpenStack.

#### **Prerequisites:**

You need to run the **manila type-create test\_share\_type False** command to create a share type.

Creating a share type named **test\_share\_type** is used as an example.

- 5.1 Property Configuration
- 5.2 SmartDedupe Property Configuration
- 5.3 SmartCompression Property Configuration
- 5.4 SmartCache Property Configuration
- 5.5 SmartPartition Property Configuration
- 5.6 SmartQoS Property Configuration
- 5.7 Create a share on a certain storage pool
- 5.8 Create a share with a certain disk type
- 5.9 SectorSize Configuration

5.10 Replication Configuration

# **5.1 Property Configuration**

**Step 1** Configure Thin property:Run the following command to configure the key-value pair whose Thin property is **true**:

```
root@ubuntu:~manila type-key test_share_type set
capabilities:thin_provisioning='<is> true'
```

Configure Thick property:Run the following command to configure the key-value pair whose Thin property is **false**:

```
root@ubuntu:~manila type-key test_share_type set
capabilities:thin_provisioning='<is> false'
```

Step 2 Run manila create --name test001 NFS 2 --share-type test\_share\_type to create a share that supports the preceding properties.

----End

#### NOTE

- If "capabilities:thin\_provisioning" is set in the share type extra-specs, it will be used (thin share will be created if "capabilities:thin\_provisioning=<is> true", thick share will be created if "capabilities: thin provisioning=<is> false").
- If "capabilities:thin provisioning" is not set in the share type extra-specs, thin share will be created.

# 5.2 SmartDedupe Property Configuration

**Step 1** Run the following command to configure the key-value pair whose SmartDedupe property is **true**:

```
root@ubuntu:~#manila type-key test share type set capabilities:dedupe='<is> true'
```

Step 2 Run manila create --name test001 NFS 2 --share-type test\_share\_type to create a share that supports the preceding properties.

----End

NOTE

Only "Thin" share supports SmartDedupe.

Refer to section 4.1 to configure thin property.

# 5.3 SmartCompression Property Configuration

**Step 1** Run the following command to configure the key-value pair whose SmartCompression is **true**:

root@ubuntu:~#manila type-key test\_share\_type set capabilities:compression='<is>

Step 2 Run manila create --name test001 NFS 2 --share-type test\_share\_type to create a share that supports the preceding properties.

#### NOTE

Only "Thin" share supports SmartCompression. Refer to section 4.1 to configure thin property.

# 5.4 SmartCache Property Configuration

**Step 1** Run the following command to configure the key-value pair whose SmartCache property is **true**:

```
root@ubuntu:~#manila type-key test_share_type set
capabilities:huawei_smartcache='<is> true'
```

Configure a name for the SmartCache existing on the storage device.

```
root@ubuntu:~#manila type-key test_share_type set
huawei smartcache:cachename='test name'
```

Step 2 Run manila create --name test001 NFS 2 --share-type test\_share\_type to create a share that supports the preceding properties.

----End

# 5.5 SmartPartition Property Configuration

**Step 1** Run the following command to configure the key-value pair whose SmartPartition property is **true**:

```
root@ubuntu:~#manila type-key test_share_type set
capabilities:huawei_smartpartition='<is> true'
```

Configure a name for the SmartPartition existing on the storage device.

```
root@ubuntu:~#manila type-key test_share_type set
huawei_smartpartition:partitionname='test_name'
```

Step 2 Run manila create --name test001 NFS 2 --share-type test\_share\_type to create a share that supports the preceding properties.

----End

# 5.6 SmartQoS Property Configuration

#### **About This Chapter**

Huawei supports the following QoS properties. One or multiple properties in the same class can be configured in one QoS property simultaneously.

Protection policies: latency, minIOPS, minBandWidth

Restriction policies: maxIOPS, maxBandWidth

#### **CAUTION**

Protection policies and Restriction policies are mutually exclusive. If they are configured together, shares will fail to be created.

"IOType" is mandatory. If it isn't configured in qos, shares will fail to be created.

## 5.6.1 QoS Configuration Versions

Table 5-1 Support for configurations of storage systems with multiple QoS properties

| Storage Product Model | Storage System Version |
|-----------------------|------------------------|
| 18000                 | V300R003C00            |
| V3                    | V300R003C00            |

## 5.6.2 Configuring the Control IOPS

Configuring the control IOPS involves configuring the maximum control IOPS and minimum control IOPS.

#### 5.6.2.1 Configuring the Maximum Control IOPS

This section describes how to configure the maximum Control IOPS.

#### Procedure

**Step 1** Run the following command to configure the key-value pair whose QoS property is **true**.

root@ubuntu:~# manila type-key test\_share\_type set capabilities:qos='<is> true'

Run the following command to configure QoS control property parameters.

root@ubuntu:~# manila type-key test\_share\_type set qos:IOType=0 qos:maxIOPS=50

- maxIOPS: indicates the maximum IOPS. The value is an integer larger than 0.
- **IOType** (mandatory): indicates the read and write type.0 indicates the control read I/Os, 1 indicates the control write I/Os, 2 indicates the control read and write I/Os.
- Step 2 Run manila create --name test001 NFS 2 --share-type test\_share\_type to create a share that supports the preceding properties.

----End

#### 5.6.2.2 Configuring the Minimum Control IOPS

This section describes how to configure the minimum Control IOPS.

#### **Procedure**

**Step 1** Run the following command to configure the key-value pair whose QoS property is **true**.

root@ubuntu:~# manila type-key test share type set capabilities:qos='<is> true'

Run the following command to configure QoS control property parameters.

root@ubuntu:~# manila type-key test\_share\_type set qos:IOType=0 qos:minIOPS=50

- minIOPS: indicates the minimum IOPS. The value is an integer larger than 0.
- **IOType** (mandatory): indicates the read and write type.0 indicates the control read I/Os, 1 indicates the control write I/Os, 2 indicates the control read and write I/Os.
- Step 2 Run manila create --name test001 NFS 2 --share-type test\_share\_type to create a share that supports the preceding properties.

----End

### 5.6.3 Configuring the Control Bandwidth

Configuring the control bandwidth involves configuring the maximum control bandwidth and minimum control bandwidth.

#### 5.6.3.1 Configuring the Maximum Control Bandwidth

This section describes how to configure the maximum control bandwidth.

#### **Procedure**

**Step 1** Run the following command to configure the key-value pair whose QoS property is **true**.

root@ubuntu:~# manila type-key test share type set capabilities:qos='<is> true'

Run the following command to configure QoS control property parameters.

root@ubuntu:~# manila type-key test\_share\_type set qos:IOType=0
qos:maxBandWidth=50

- maxBandWidth: indicates the maximum BANDWIDTH. The value is an integer larger than 0 and expressed in MB/s.
- **IOType** (mandatory): indicates the read and write type.0 indicates the control read I/Os, 1 indicates the control write I/Os, 2 indicates the control read and write I/Os.
- Step 2 Run manila create --name test001 NFS 2 --share-type test\_share\_type to create a share that supports the preceding properties.

----End

#### 5.6.3.2 Configuring the Minimum Control Bandwidth

This section describes how to configure the minimum control bandwidth.

#### **Procedure**

**Step 1** Run the following command to configure the key-value pair whose QoS property is **true**.

root@ubuntu:~# manila type-key test share type set capabilities:qos='<is> true'

Run the following command to configure QoS control property parameters.

root@ubuntu:~# manila type-key test\_share\_type set qos:IOType=0
qos:minBandWidth=50

• minBandWidth: indicates the minimum BANDWIDTH. The value is an integer larger than 0 and expressed in MB/s.

- **IOType** (mandatory): indicates the read and write type.0 indicates the control read I/Os, 1 indicates the control write I/Os, 2 indicates the control read and write I/Os.
- Step 2 Run manila create --name test001 NFS 2 --share-type test\_share\_type to create a share that supports the preceding properties.

----End

## 5.6.4 Configuring the Control Latency

This section describes how to configure the minimum control latency.

#### **Procedure**

**Step 1** Run the following command to configure the key-value pair whose QoS property is **true**.

root@ubuntu:~# manila type-key test\_share\_type set capabilities:qos='<is> true'

Run the following command to configure QoS control property parameters.

root@ubuntu:~# manila type-key test share type set qos:IOType=0 qos:latency=50

- **latency**: indicates the maximum LATENCY. The value is an integer larger than **0** and expressed in ms.
- **IOType** (mandatory): indicates the read and write type.0 indicates the control read I/Os, 1 indicates the control write I/Os, 2 indicates the control read and write I/Os.
- Step 2 Run manila create --name test001 NFS 2 --share-type test\_share\_type to create a share that supports the preceding properties.

----End

### 5.6.5 Configuring Multiple Control Policies

This section describes how to configure multiple control policies.

#### **Procedure**

**Step 1** Run the following command to configure the key-value pair whose QoS property is **true**.

root@ubuntu:~# manila type-key test\_share\_type set capabilities:qos='<is> true'

Run the following command to configure QoS control property parameters.

root@ubuntu:~# manila type-key test\_share\_type set qos:IOType=0 qos:latency=50

- latency: indicates the maxinum LATENCY. The value is an integer larger than **0**.
- minIOPS: indicates the minimum IOPS. The value is an integer larger than 0.
- minBandWidth: indicates the minimum BANDWIDTH. The value is an integer larger than 0
- **IOType** (mandatory): indicates the read and write type.0 indicates the control read I/Os, 1 indicates the control write I/Os, 2 indicates the control read and write I/Os.
- Step 2 Run manila create --name test001 NFS 2 --share-type test\_share\_type to create a share that supports the preceding properties.

# 5.7 Create a share on a certain storage pool

This section describes how to create a share on a certain storage pool.

#### **Procedure**

- Step 1 Run the manila type-create target\_pool\_type False command to create a share type.

  "target\_pool\_type"indicates the name of a share type. "False"indicates that the multi-tenant mode is not supported, when configured to "True" means that the multi-tenant mode is supported.
- **Step 2** Run the following command to configure the assign storagepool.
  - Configure a single assign pool root@ubuntu:~# manila type-key target pool type set pool name=StoragePool001
  - Configure multiple assign pools.

    root@ubuntu:~# manila type-key target\_pool\_type set pool\_name="<or>
    StoragePool001 <or> StoragePool002"
- Step 3 Run manila create --name test001 NFS 2 --share-type target\_pool\_type to create a share that supports the preceding properties.

----End

# 5.8 Create a share with a certain disk type

This section describes how to create a share with a certain disk type.

#### **Procedure**

- Step 1 Run the manila type-create disk\_type False command to create a share type.

  "disk\_type"indicates the name of a share type. "False"indicates that the multi-tenant mode is not supported, when configured to "True" means that the multi-tenant mode is supported.
- **Step 2** Run the following command to configure the assign disk type.
  - Configure one type of disk type.
    root@ubuntu:~# manila type-key disk\_type set huawei\_disk\_type=sas
  - Configure multiple types of disk type.

    root@ubuntu:~# manila type-key disk\_type set huawei\_disk\_type="<or>
    ssd"

optional values of disk type can be "ssd", "sas", "nl\_sas" or "mix", and the "mix" is a mixture of two or more in "ssd", "sas", "nl sas".

Step 3 Run manila create --name test001 NFS 2 --share-type disk\_type to create a share that supports the preceding properties.

----End

# 5.9 SectorSize Configuration

This section describes how to configure the size of blocks of filesystem.

#### **Procedure**

- Step 1 Run the manila type-create sectorsize\_type False command to create a share type. "sectorsize\_type"indicates the name of a share type. "False"indicates that the multi-tenant mode is not supported, when configured to "True" means that the multi-tenant mode is supported.
- **Step 2** Run the following command to configure the key-value pair whose SectorSize property is **true**:

```
root@ubuntu:~# manila type-key sectorsize_type set
capabilities:huawei_sectorsize='<is> true'
```

#### Configure the value of sectorsize:

root@ubuntu:~# manila type-key sectorsize\_type set huawei\_sectorsize:sectorsize=4

#### NOTE

'SectorSize' is the size of the disk blocks, optional value can be "4", "8", "16", "32" or "64", and the units is KB. If "sectorsize" is configured in both share\_type and xml file, the value of sectorsize in the share\_type will be used. If "sectorsize" is configured in neither share\_type nor xml file, huawei storage backends will provide a default value(64) when creating a new share.

----End

# 5.10 Replication Configuration

This section describes how to configure Replication.

#### **Prerequisites**

**Step 1** Configure two back-ends in "/etc/manila/manila.conf" file for replication.

```
[DEFAULT]
...
enabled_backends = huawei_manila_1, huawei_manila_2
...

[huawei_manila_1]
share_driver = manila.share.drivers.huawei.huawei_nas.HuaweiNasDriver
manila_huawei_conf_file = /etc/manila/manila_huawei_conf_1.xml
driver_handles_share_servers = False
replication_domain = huawei_domain

[huawei_manila_2]
share_driver = manila.share.drivers.huawei.huawei_nas.HuaweiNasDriver
manila_huawei_conf_file = /etc/manila/manila_huawei_conf_2.xml
driver_handles_share_servers = False
replication_domain = huawei_domain
```

#### NOTE

- The replication\_domain option is a backend specific StrOpt option to be used within manila.conf.
   The value can be any ASCII string. Two backends that can replicate between each other would have the same replication\_domain.
- For more details about "manila\_huawei\_conf\_1.xml" and "manila\_huawei\_conf\_2.xml" please refer to chapter 4 Manila Driver Basis Properties Configuration.

#### **Step 2** Restart the Manila services.

#### **Procedure**

- **Step 1** Run the **manila type-create replication\_type False** command to create a share type. "replication\_type" indicates the name of a share type. "False" indicates that the multi-tenant mode is not supported, when configured to "True" means that the multi-tenant mode is supported.
- Step 2 Run the following command to configure the type of replication.

  root@ubuntu:~# manila type-key replication type set replication type=dr
- Step 3 Run manila create --name test001 NFS 2 --share-type replication\_type to create a share that supports the preceding properties.
- Step 4 Run manila share-replica-create test001 to create replication for share test001.

NOTE

Now Huawei Manila Driver only supports **dr** style replication. For more details about **dr**, please refer to **http://docs.openstack.org/developer/manila/devref/share\_replication.html**.
